

ABSTRACT OF DISCLOSURE

A system to control a plurality of server computers as a group on a single client computer. An input/output (I/O) control system controls the command input/output from a plurality of consoles to a single server. The input/output control system controls the I/O status
5 of the commands from each console to the server, and controls the I/O of commands from the various consoles based on the respective I/O statuses. A console display receives a message from a server and displays server console information in a manner identifiable from other server console information in response to the message received from the server.
